

Cucumber green mottle mosaic virus in California

Tera Pitman, M.Sc.

University of California Davis

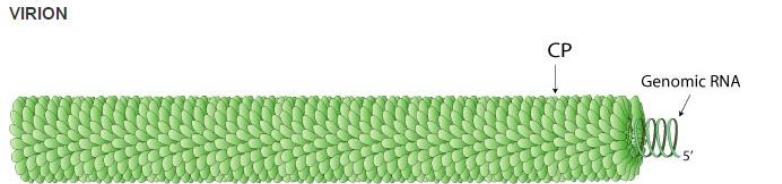

Overview

- CGMMV biology
- CGMMV in California
- Isolate sequencing
- Diagnostics research
- Watermelon green mottle mosaic virus

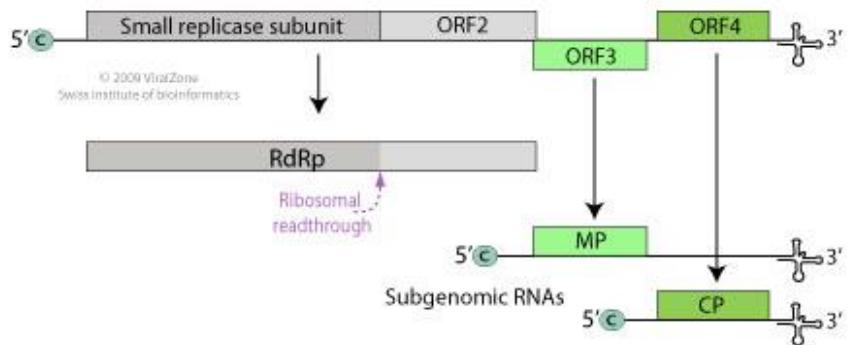

The virus

- Family Virgaviridae, genus Tobamovirus
- 6,421-6,425 nucleotide +ssRNA genome
- Four protein open reading frames
- Mechanically transmitted
- Seed transmitted

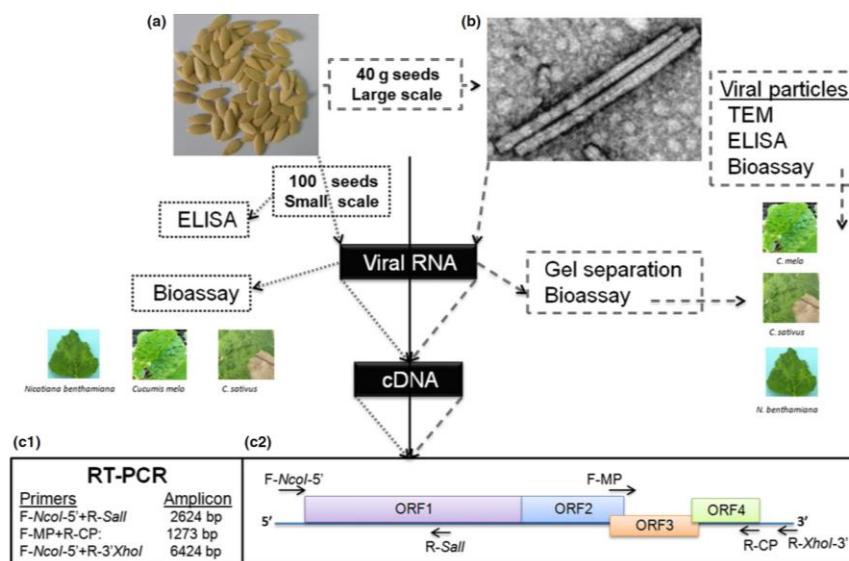

GENOME

Seed disinfection treatments do not sufficiently eliminate the infectivity of Cucumber green mottle mosaic virus (CGMMV) on cucurbit seeds

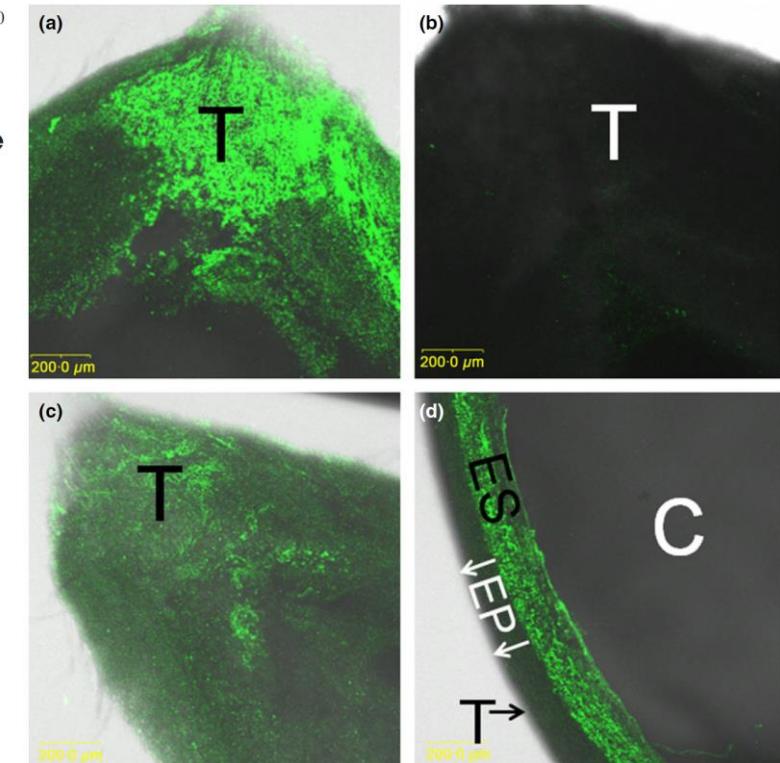

V. Reingold^a, O. Lachman^a, E. Blaosov^b and A. Dombrovsky^{a*}

^aDepartment of Plant Pathology, ARO, The Volcani Center, Bet Dagan 50250; and ^bDepartment of Plant Science, ARO, The Volcani Center, Bet Dagan 50250, Israel

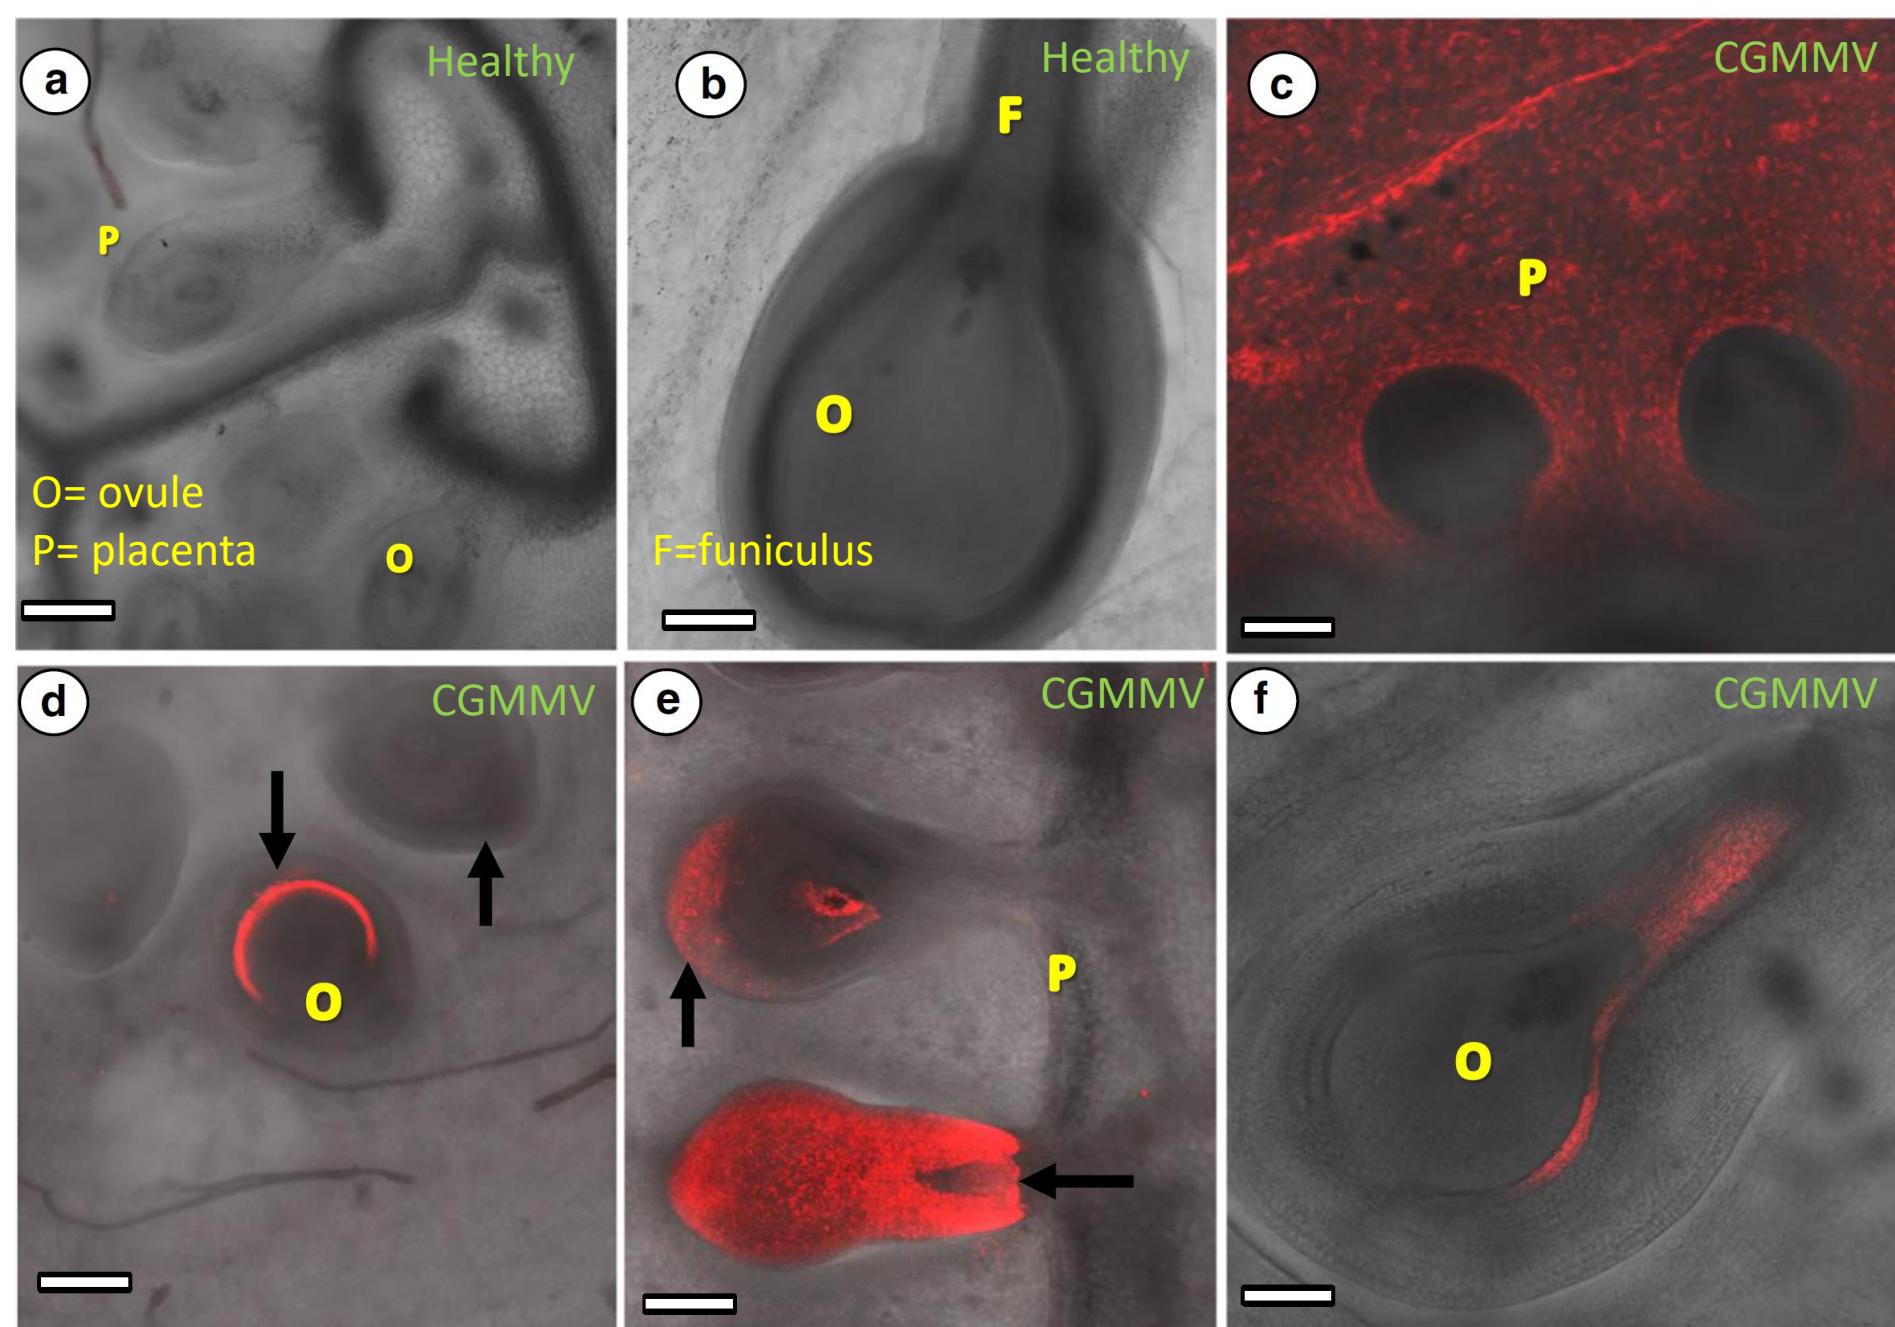

Analysis	Amount of seeds	Seed treatment			
		Control (untreated)	Chemical (10% TSP)	Heat (72°C, 72 h)	Combined treatment (10% TSP+heat 72°C, 72 h)
ELISA	40 g	+	+	+	+
	100 seeds	+	+	+	+
Fluorescence labelling	10 seeds	+	+	+	+
TEM	40 g	+	+	+	+
RNA	40 g	+	+	+	-
PCR for CP-MP	40 g	+	+	+	+
	100 seeds	+	+	+	+
LD-PCR	40 g	+	+	+	-
	100 seeds	+	+	-	-
Biological test	40 g	+	+	+	+
	100 seeds	+	+	+	+

+, presence of CGMMV; -, absence of CGMMV.

Fluorescent *in-situ* hybridization of: A. CGMMV infected testa B. CGMMV free seed testa C. Heat+TSP treated CGMMV testa D. Inner tissue of heat+TSP treated seed. T=testa EP=endopleura

Bar = 100 μ m.

Insights into the maternal pathway for *Cucumber green mottle mosaic virus* infection of cucurbit seeds

Protoplasma (2019) 256:1109–1118
<https://doi.org/10.1007/s00709-019-01370-6>

How many plants develop systemic infections of CGMMV from contaminated seeds?

Watermelon planting density: 5,000 plants per acre

CGMMV watermelon seed transmission rate: 1-5%

Seed contamination rate: 1 in 2,000 or 1/500

$1,000 \text{ acres} * 5,000 \text{ plants/acre} * 1/2,000 \text{ seeds} * 1\text{-}5\% = 25 \text{ to } 125 \text{ CGMMV infected plants}$

$1,000 \text{ acres} * 5,000 \text{ plants/acre} * 1/5,000 \text{ seeds} * 1\text{-}5\% = 10 \text{ to } 50 \text{ CGMMV infected plants}$

2018 US watermelon production 113,000 acres (USDA-Economic research Service)

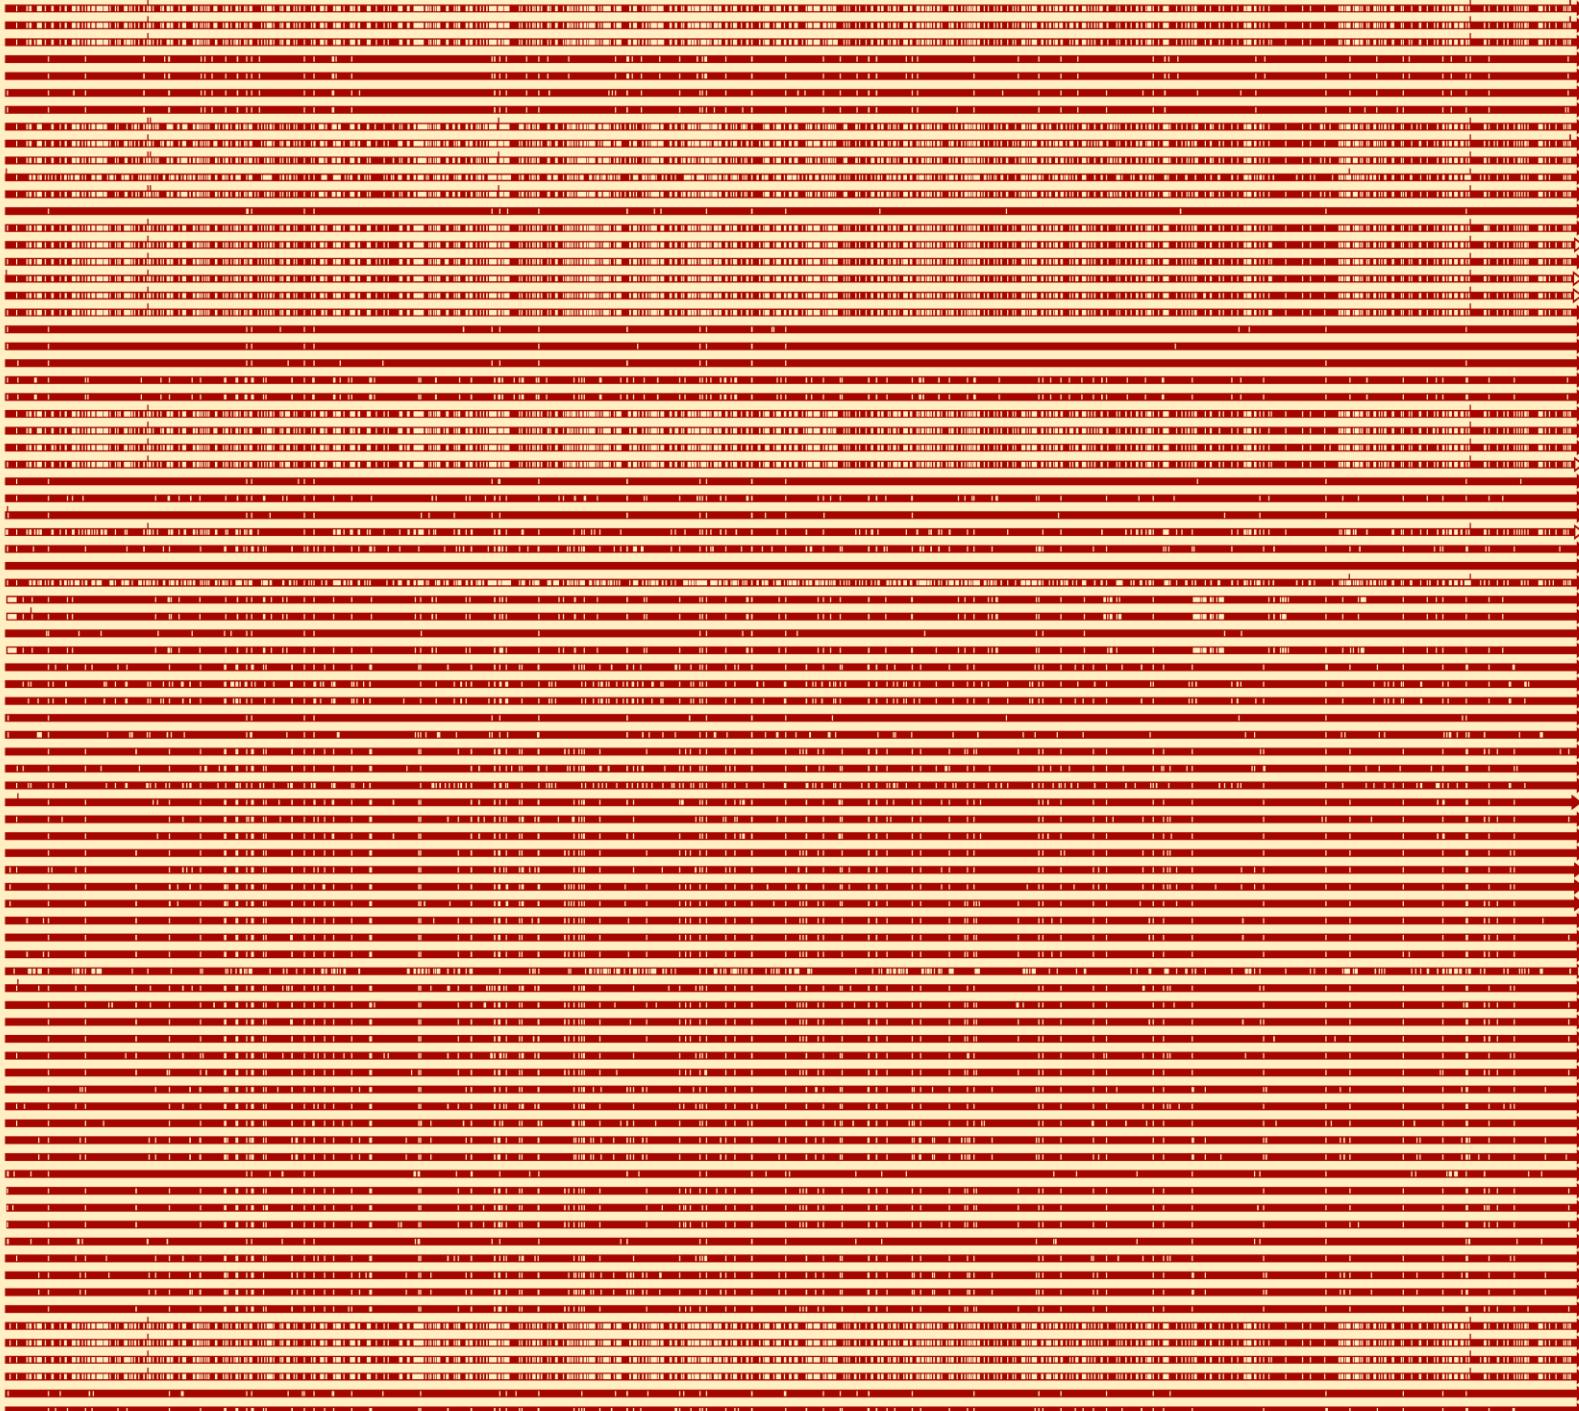

Triploid watermelon field
San Joaquin County, CA
August 2014
100% CGMMV infection rate in field due to
mechanical transmission

California timeline

- 2013: One county, 5 acres of seed production
- 2014: Four counties, all in triploid watermelon, three isolates of CGMMV
- 2015: no reported CGMMV
- 2016: ?
- 2017: three seed production fields (post-harvest seed detection), one small farm in Fresno county
- 2018: seven seed production fields (one field detection, six post-harvest seed detections); one small farm in Fresno county

Watermelon green mottle mosaic virus in California

- Accidental identification in diagnostic samples
- Discovered in Fresno County
- Very small acreage farms for intrastate markets
- Mixed infections with CGMMV
- 3 distinct isolates so far
